

How to add device into Guard Viewer Mobile App

Warm Tips: If we want to view our security system from our mobile app or any remote area, we have to make the NVR video recorder into internet. Which means the below “WAN port” need to be connected into your router. And if you have two or more router in your network, **we need to connect NVR recorder into the main router** for p2p penetration, otherwise, it may not able to view remotely.

Step 1: After connecting your NVR to the router. Let's login your system, main menu>network>basic>TCP/IP, and select “Enable DHCP” checkbox.

This step is making the system can be connected and obtain IP address from your router, and making the system with internet access.

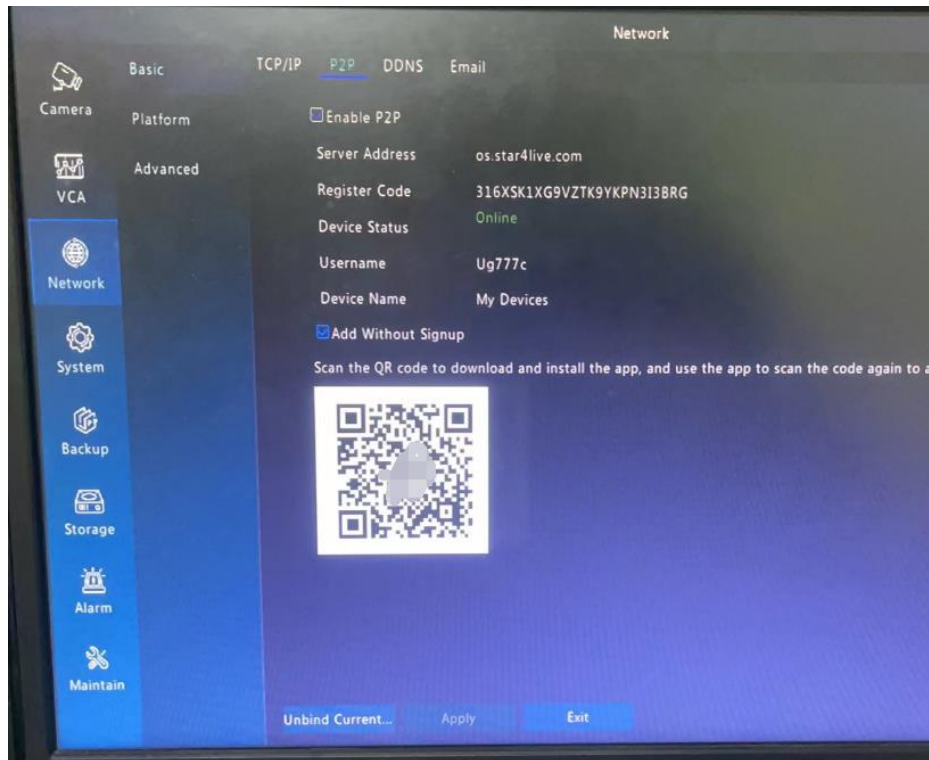

Step 2: “Guard Viewer” mobile application registration.

After downloading “Guard Viewer” from App Store or Google market, we need to register in advance.

Please note there will be verification code send to your email, please check if it is in your junk email. Or you can refer the video guidance: <https://youtu.be/rhQbEMpE8AU>

Step 3: Add device (NVR recorder) into the guard viewer App.

We need to find QR code from the NVR recorder, like picture below. Check it from **“Main Menu”> “Network” > “Basic” > “P2P”**. Or you can refer the video guidance: Device add into Guard Viewer App: <https://youtu.be/jgc0S1Oc38o>

Please note: In order to make your mobile App could monitor the system when you outside or stay in different network, please making sure add device by **“Scan”**. DO NOT add device by auto search in LAN since this type is adding the recorder as an local ip address, not WAN.
